

Implement the database using embedded SQL (Python and SQLite as in the assignment).

- A. Develop SQL code to create the entire database schema, reflecting the constraints identified in previous steps.

```
Table: Outlet
Columns: outletNo, address, phone, fax
Table: Vehicle
Columns: registrationNo, model, make, engineSize, capacity, mileage, dailyHireRate, outletNo
Table: Client
Columns: clientNo, fName, lName, address, phone, DOB, licenseNo
Table: HireAgreement
Columns: hireNo, agreementStart, agreementEnd, startingMileage, endingMileage, clientNo, registrat
Table: Staff
Columns: staffNo, fName, lName, address, phone, DOB, sex, outletNo
```

- B. Create at least 5 tuples for each relation in your database.

	outletNo	address	phone	\

- D. Upload all the code and documentation (including previous project submissions) to GitHub.

Notes: A report will be created for each deadline including detailed documentation of each of the steps addressing all the required items. Screenshots of the contents of the database created for each portion of this part must be included in the report and the corresponding queries to show the table contents must be included in the code.

GitHub: The code generated must be uploaded to a GitHub repository. The link to the repository must be provided in the last report. The GitHub repository must also include all the documentation (i.e., reports) generated in the three project parts. The GitHub should be organized containing appropriate folders and a README file with a description of the project should be included.
